**Abstract - In this paper, a new set called sga-closed set is introduced. Also, its properties were studied.**

**Keywords: sga-closed sets and sga-open sets.**

## I. INTRODUCTION

N. Levine [7] introduced generalized closed sets (briefly g-closed set) in 1970. N. Levine [12] introduced the concepts of semi-open sets in 1963. Bhattacharya and Lahiri [3] introduced and investigated semi-generalized closed (briefly sg-closed) sets in 1987. Arya and Nour [2] defined generalized semi-closed (briefly gs-closed) sets for obtaining some characterization of s-normal spaces in 1990. O.Njastad in 1965 defined  $\alpha$ -open sets [12]. In this paper, a new set called semi-generalized  $\alpha$ -closed sets (briefly sga-closed) is introduced their properties were studied.

Throughout the paper  $X$  and  $Y$  denote the topological spaces  $(X, \tau)$  and  $(Y, \sigma)$  respectively and on which no separation axioms are assumed unless otherwise explicitly stated.

## II. PRELIMINARIES

A subset  $A$  of a topological space  $X$  is said to be open if  $A \in \tau$ . A subset  $A$  of a topological space  $X$  is said to be closed if the set  $X - A$  is open. The interior of a subset  $A$  of a topological space  $X$  is defined as the union of all open sets contained in  $A$ . It is denoted by  $\text{int}(A)$ . The closure of a subset  $A$  of a topological space  $X$  is defined as the intersection of all closed sets containing  $A$ . It is denoted by  $\text{cl}(A)$ .

### Definitions 2.1.

1. A subset  $A$  of a space  $(X, \tau)$  is said to be semi open [6] if  $A \subseteq \text{cl}(\text{int}(A))$  and semi closed if  $\text{int}(\text{cl}(A)) \subseteq A$ .
2. A subset  $A$  of a space  $(X, \tau)$  is said to be  $\alpha$ -open [12] if  $A \subseteq \text{int}(\text{cl}(\text{int}(A)))$  and  $\alpha$ -closed if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ .
3. A subset  $A$  of a space  $(X, \tau)$  is said to be  $\beta$ -open or semi pre-open [1] if  $A \subseteq \text{cl}(\text{int}(\text{cl}(A)))$  and  $\beta$ -closed or semi pre-closed if  $\text{int}(\text{cl}(\text{int}(A))) \subseteq A$ .

4. A subset  $A$  of a space  $(X, \tau)$  is said to be pre-open [11] if  $A \subseteq \text{int}(\text{cl}(A))$

and pre-closed if  $\text{cl}(\text{int}(A)) \subseteq A$ .

The complement of a semi-open (resp. pre-open,  $\alpha$ -open,  $\beta$ -open) set is called semi-closed (resp. pre-closed,  $\alpha$ -closed,  $\beta$ -closed). The intersection of all semi-closed (resp. pre-closed,  $\alpha$ -closed,  $\beta$ -closed) sets containing  $A$  is called the semi-closure (resp. pre-closure,  $\alpha$ -closure,  $\beta$ -closure) of  $A$  and is denoted by  $\text{scl}(A)$  (resp.  $\text{pcl}(A)$ ,  $\alpha\text{-cl}(A)$ ,  $\beta\text{-cl}(A)$ ). The union of all semi-open (resp. pre-open,  $\alpha$ -open,  $\beta$ -open) sets contained in  $A$  is called the semi-interior (resp. pre-interior,  $\alpha$ -interior,  $\beta$ -interior) of  $A$  and is denoted by  $\text{sint}(A)$  (resp.  $\text{pint}(A)$ ,  $\alpha\text{-int}(A)$ ,  $\beta\text{-int}(A)$ ). The family of all semi-open (resp. pre-open,  $\alpha$ -open,  $\beta$ -open) sets is denoted by  $\text{SO}(X)$  (resp.  $\text{PO}(X)$ ,  $\alpha\text{-O}(X)$ ,  $\beta\text{-O}(X)$ ). The family of all semi-closed (resp. pre-closed,  $\alpha$ -closed,  $\beta$ -closed) sets is denoted by  $\text{SCl}(X)$  (resp.  $\text{PCl}(X)$ ,  $\alpha\text{-Cl}(X)$ ,  $\beta\text{-Cl}(X)$ ). Definitions 2.2.

1. A subset  $A$  of a space  $(X, \tau)$  is called generalized-closed set [7] (briefly g-closed) if  $\text{cl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ . The complement of a g-closed set is called g-open set.
2. A subset  $A$  of a space  $(X, \tau)$  is called generalized semi-closed set [12] (briefly gs-closed set) if  $\text{scl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
3. A subset  $A$  of a space  $(X, \tau)$  is called semi-generalized closed set [3] (briefly sg-closed set) if  $\text{scl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is semi-open in  $(X, \tau)$ .
4. A subset  $A$  of a space  $(X, \tau)$  is called  $\alpha$  generalized-closed set [9] (briefly  $\alpha$ g-closed) if  $\alpha\text{-cl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
5. A subset  $A$  of a space  $(X, \tau)$  is called generalized  $\alpha$ -closed set [8] (briefly  $\alpha$ g $\alpha$ -closed) if  $\alpha(\text{cl}(A)) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $(X, \tau)$ .
6. A subset  $A$  of a space  $(X, \tau)$  is called generalized pre-closed set [10] (briefly gp-closed) if  $\text{pcl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .

7. A subset  $A$  of a space  $(X, \tau)$  is called generalized semi-pre closed set [4] (briefly gsp-closed) if  $\text{spl}(A) \subseteq U$ , whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .

### III. $sg\alpha$ -CLOSED SETS IN TOPOLOGICAL SPACES

In this section the notion of a new class of sets called  $sg\alpha$ -closed sets in topological spaces is introduced and their properties were studied.

**Definition 3.1** A subset  $A$  of space  $(X, \tau)$  is called  $sg\alpha$ -closed if  $\text{scl}(A) \subseteq U$ ,

whenever  $A \subseteq U$  and  $U$  is  $\alpha$ -open in  $X$ .

The family of all  $sg\alpha$ -closed subsets of the space  $X$  is denoted by  $SG\alpha C(X)$ .

**Definition 3.2** The intersection of all  $sg\alpha$ -closed sets containing a set  $A$  is called  $sg\alpha$ -closure of  $A$  and is denoted by  $sg\alpha\text{-cl}(A)$ .

A set  $A$  is  $sg\alpha$ -closed set if and only if  $sg\alpha\text{-Cl}(A) = A$ .

**Definition 3.3** A subset  $A$  in  $X$  is called  $sg\alpha$ -open in  $X$  if  $A^c$  is  $sg\alpha$ -closed in  $X$ .

The family of a  $sg\alpha$ -open sets is denoted by  $SG\alpha O(X)$ .

**Definition 3.4** The union of all  $sg\alpha$ -open sets containing a set  $A$  is called  $sg\alpha$ -interior of  $A$  and is denoted by  $sg\alpha\text{-Int}(A)$ .

A set  $A$  is  $sg\alpha$ -open set if and only if  $sg\alpha\text{-Int}(A) = A$ .

**Theorem 3.5** Every closed set is a  $sg\alpha$ -closed set.

**Proof:** Let  $A$  be a closed set and  $U$  be any  $\alpha$ -open set containing  $A$ . Since  $A$  is closed,  $\text{cl}(A) = A$ . For every subset  $A$  of  $X$ ,  $\text{scl}(A) \subseteq \text{cl}(A) = A \subset U$  and so we have  $\text{scl}(A) \subseteq U$ . Hence  $A$  is  $sg\alpha$ -closed.

**Remark 3.6** The converse of the above theorem need not be true as seen from the following example.

**Example 3.7** Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \emptyset, \{b, c\}\}$ . Then

$A = \{a, b\}$  is  $sg\alpha$ -closed but not a closed set of  $(X, \tau)$ .

**Theorem 3.8** Every  $g\alpha$  closed set is a  $sg\alpha$ -closed set.

**Proof:** Proof follows from the definition obviously.

**Remark 3.9** The converse of the above theorem need not be true as seen from the following example.

**Example 3.10** Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \emptyset, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ . Then  $A = \{b\}$  is  $sg\alpha$ -closed but not  $g\alpha$  closed set of  $(X, \tau)$ .

**Theorem 3.11** Every  $sg\alpha$  closed set is a  $sg$ -closed set.

**Proof:** The proof follows from the definition and the fact that every semi-open set is  $\alpha$ -open.

**Remark 3.12** The converse of the above theorem need not be true as seen from the following example.

**Example 3.13** Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \emptyset, \{c\}, \{a, c\}\}$ . Then  $A = \{a\}$  is  $sg$ -closed but not  $sg\alpha$  closed set of  $(X, \tau)$ .

**Theorem 3.14** Every  $sg\alpha$  closed set is a  $gs$ -closed set.

**Proof:** The proof follows from the definition and the fact that every open set is  $\alpha$ -open.

**Remark 3.15** The converse of the above theorem need not be true as seen from the following example.

**Example 3.16** Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \emptyset, \{c\}, \{a, c\}\}$ . Then  $A = \{b, c\}$  is  $gs$ -closed but not  $sg\alpha$  closed set of  $(X, \tau)$ .

**Theorem 3.17** Every  $sg\alpha$  closed set is a  $gsp$ -closed set.

**Proof:** Let  $A$  be a  $sg\alpha$ -closed set. Let  $A \subseteq U$  and  $U$  be open. Then  $A \subseteq U$  and  $U$  is  $\alpha$ -open and  $\text{scl}(A) \subseteq U$ . Since every open set is  $\alpha$ -open.  $A$  is  $sg\alpha$ -closed. Then  $\text{spl}(A) \subseteq \text{scl}(A) \subseteq U$ . Hence  $A$  is  $gsp$ -closed.

**Remark 3.18** The converse of the above theorem need not be true as seen from the following example.

**Example 3.19** Let  $X = \{a, b, c\}$  with topology  $\tau = \{X, \emptyset, \{a, b\}\}$ . Then  $A = \{a\}$  is  $gsp$ -closed but not  $sg\alpha$  closed set of  $(X, \tau)$ .

**Theorem 3.20** The union of two  $sg\alpha$ -closed subsets of  $X$  is also  $sg\alpha$ -closed subset of  $X$ .

**Proof:** Assume that  $A$  and  $B$  are  $sg\alpha$ -closed set in  $X$ . Let  $U$  be  $\alpha$ -open in  $X$  such that  $A \cup B \subset U$ . Then  $A \subset U$  and  $B \subset U$ . Since  $A$  and  $B$  are  $sg\alpha$ -closed,  $\text{scl}(A) \subset U$  and  $\text{scl}(B) \subset U$ . Hence  $\text{scl}(A \cup B) = (\text{scl}(A) \cup \text{scl}(B)) \subset U$ . That is  $\text{scl}(A \cup B) \subset U$ . Therefore  $A \cup B$  is  $sg\alpha$ -closed set in  $X$ .

**Remark 3.21** The intersection of two  $sg\alpha$ -closed sets in  $X$  is generally not  $sg\alpha$ -closed set in  $X$ .

**Example 3.22** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \emptyset, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$ . If  $A = \{a, b, c\}$  and  $B = \{a, d, e\}$ , then  $A$  and  $B$  are  $sg\alpha$ -closed sets in  $X$ , but  $A \cap B = \{a\}$  is not a  $sg\alpha$ -closed set of  $X$ .

**Theorem 3.23** If a subset  $A$  of  $X$  is  $sg\alpha$ -closed set in  $X$ . Then  $scl(A) \setminus A$  does not contain any nonempty  $\alpha$ -open set in  $X$ .

*Proof:* Suppose that  $A$  is  $sg\alpha$ -closed set in  $X$ . We prove the result by contradiction. Let  $U$  be a  $\alpha$ -open set such that  $scl(A) \setminus A \supset U$  and  $U \neq \emptyset$ . Now  $U \subset scl(A) \setminus A$ . Therefore  $U \subset X \setminus A$  which implies  $A \subset X \setminus U$ . Since  $U$  is  $\alpha$ -open set,  $X \setminus U$  is also  $\alpha$ -open in  $X$ . Since  $A$  is  $sg\alpha$ -closed set in  $X$ , by definition we have  $scl(A) \subset X \setminus U$ . So  $U \subset X \setminus scl(A)$ . Also  $U \subset scl(A)$ . Therefore  $U \subset (scl(A) \cup (X \setminus scl(A))) = \emptyset$ . This shows that,  $U = \emptyset$  which is contradiction. Hence  $scl(A) \setminus A$  does not contain any nonempty  $\alpha$ -open set in  $X$ .

**Remark 3.24** The converse of the above theorem need not be true seen from following example.

**Example 3.25** If  $scl(A) \setminus A$  contains no nonempty  $sg\alpha$ -open subset in  $X$ , then  $A$  need not be  $sg\alpha$ -closed set. Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \emptyset, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$  and  $A = \{a, b\}$ . Then  $scl(A) \setminus A = \{a, b, c\} \setminus \{a, b\} = \{c\}$  does not contain nonempty  $\alpha$ -open set in  $X$ , but  $A$  is not a  $sg\alpha$ -closed set in  $X$ .

**Corollary 3.26** If a subset  $A$  of  $X$  is  $sg\alpha$ -closed set in  $X$  then  $scl(A) \setminus A$  does not contain any open set in  $X$  but not conversely.

*Proof:* Follows from theorem 3.23 and the fact that every open set is  $\alpha$ -open.

**Corollary 3.27** If a subset  $A$  of  $X$  is  $sg\alpha$ -closed set in  $X$  then  $scl(A) \setminus A$  does not contain any non empty closed set in  $X$  but not conversely.

*Proof:* Follows from theorem 3.23 and the fact that every open set is  $\alpha$ -open.

**Theorem 3.28** For an element  $x \in X$ , the set  $X \setminus \{x\}$  is  $sg\alpha$ -closed or  $\alpha$ -open.

*Proof:* Suppose  $X \setminus \{x\}$  is not  $\alpha$ -open set. Then  $X$  is the only  $\alpha$ -open set containing  $X \setminus \{x\}$ . This implies  $scl(X \setminus \{x\}) \subset X$ . Hence  $X \setminus \{x\}$  is  $sg\alpha$ -closed set in  $X$ .

**Theorem 3.29** If  $A$  is open and  $sg\alpha$ -closed then  $A$  is closed and hence  $\alpha$ -open.

*Proof:* Suppose  $A$  is open and  $sg\alpha$ -closed. As every open set is  $\alpha$ -open and  $A \subset A$ , we have  $scl(A) \subset A$ . Also  $A \subset scl(A)$ . Therefore  $scl(A) = A$ . That is  $A$  is  $\alpha$ -closed. Since  $A$  is open,  $A$  is  $\alpha$ -open. Now  $cl(int(A)) = cl(A)$ . Therefore  $A$  is closed and  $\alpha$ -open.

**Theorem 3.30** If  $A$  is  $sg\alpha$ -closed subset of  $X$  such that  $A \subset B \subset scl(A)$ . Then  $B$  is  $sg\alpha$ -closed set in  $X$ .

*Proof:* If  $A$  is  $sg\alpha$ -closed subset of  $X$  such that  $A \subset B \subset scl(A)$ . Let  $U$  be a  $\alpha$ -open set of  $X$  such that  $B \subset U$ . Then  $A \subset U$ . Since  $A$  is a  $sg\alpha$ -closed we have  $scl(A) \subset U$ . Now  $scl(B) \subset scl(scl(A)) = scl(A) \subset U$ . Therefore  $B$  is  $sg\alpha$ -closed set in  $X$ .

**Theorem 3.31** If  $A$  is  $sg\alpha$ -closed and  $A \subset B \subset scl(A)$ , then  $B$  is  $sg\alpha$ -closed.

*Proof:* Let  $A$  be  $sg\alpha$ -closed and  $B \subset U$ , where  $U$  is  $\alpha$ -open. Then  $A \subset B$  implies  $A \subset U$ . Since  $A$  is  $sg\alpha$ -closed,  $scl(A) \subset U$ .  $B \subset scl(A)$  implies  $scl(B) \subset scl(A)$ . Therefore  $scl(B) \subset U$  and hence  $B$  is  $sg\alpha$ -closed.

**Remark 3.32** The converse of the theorem 3.31 need not be true in general as seen from following example.

**Example 3.33** Let  $X = \{a, b, c, d, e\}$  with topology  $\tau = \{X, \emptyset, \{a\}, \{d\}, \{e\}, \{a, d\}, \{a, e\}, \{d, e\}, \{a, d, e\}\}$ .  $A = \{b\}$  and  $B = \{b, c\}$ . Then  $A$  and  $B$  are  $sg\alpha$ -closed sets in  $(X, \tau)$ , but  $A \subset B$  is not subset in  $scl(A)$ .

**Theorem 3.34** Let  $A$  be a  $sg\alpha$ -closed in  $(X, \tau)$ . Then  $A$  is  $\alpha$ -closed if and only if  $scl(A) \setminus A$  is a  $\alpha$ -open.

*Proof:* Suppose  $A$  is a  $\alpha$ -closed in  $X$ . Then  $scl(A) = A$  and so  $scl(A) \setminus A = \emptyset$ , which is  $\alpha$ -open in  $X$ . Conversely, suppose  $scl(A) \setminus A$  is  $\alpha$ -open set in  $X$ . Since  $A$  is  $sg\alpha$ -closed by theorem 3.23,  $scl(A) \setminus A$  does not contain any non empty  $\alpha$ -open in  $X$ . Then  $scl(A) \setminus A = \emptyset$ , hence  $A$  is  $\alpha$ -closed set in  $X$ .

**Theorem 3.35** If a subset  $A$  of topological space  $X$  is both  $\alpha$ -open and  $sg\alpha$ -closed, then it is  $\alpha$ -closed.

*Proof:* Suppose a subset  $A$  of topological space  $X$  is both  $\alpha$ -open and  $sg\alpha$ -closed. Let  $A \subset U$  with  $U$  is  $\alpha$ -open in  $X$ . Now  $A \supset int(cl(int(A)))$ , as  $A$  is  $\alpha$ -open. That is  $scl(A) \subset A \subset U$ . Thus  $A$  is  $sg\alpha$ -closed.

**Corollary 3.36** Let  $A$  be  $\alpha$ -open and  $sg\alpha$ -closed subset in  $X$ . Suppose that  $F$  is  $\alpha$ -closed set in  $X$ . Then  $A \cap F$  is an  $sg\alpha$ -closed set in  $X$ .

*Proof:* Let  $A$  be a  $\alpha$ -open and  $sg\alpha$ -closed subset in  $X$  and  $F$  be closed. By theorem 3.14,  $A$  is  $\alpha$ -closed. So  $A \cap F$  is a  $\alpha$ -closed and hence  $A \cap F$  is  $sg\alpha$ -closed.

**Theorem 3.37** In a topological space  $X$ , if  $S\alpha O(X) = \{X, \emptyset\}$ , then every subset of  $X$  is a  $sg\alpha$ -closed set.

*Proof:* Let  $X$  be a topological space and  $S\alpha O(X) = \{X, \emptyset\}$ . Let  $A$  be any subset of  $X$ . Suppose  $A \neq \emptyset$ . Then  $\emptyset$  is  $sg\alpha$ -closed set in  $X$ . Suppose  $A = \emptyset$ . Then  $X$  is the only  $\alpha$ -open set containing  $A$  and so  $scl(A) \subset X$ . Hence  $A$  is  $sg\alpha$ -closed set in  $X$ .

**Remark 3.38** The converse of the above theorem need not be true in general as seen from the following example.

**Example 3.39** Let  $X = \{a, b, c, d\}$  with topology  $\tau = \{X, \emptyset, \{a, b\}, \{c, d\}\}$ . Then every subset of  $(X, \tau)$  is  $sg\alpha$ -closed set in  $X$ , But  $S\alpha O(X, \tau) = \{X, \emptyset, \{a, b\}, \{c, d\}\}$ .

**Theorem 3.40** In a topological space  $X, S\alpha O(X, \tau) \subset \{F \subset X : F^c \in \tau\}$  if and only if every subset of  $X$  is a  $sg\alpha$ -closed set.

**Proof:** Suppose that  $S\alpha O(X, \tau) \subset \{F \subset X : F^c \in \tau\}$ . Let  $A$  be any subset of  $X$  such that  $A \subset U$ , where  $U$  is a  $\alpha$ -open. Then  $U \in S\alpha O(X, \tau) \subset \{F \subset X : F^c \in \tau\}$ . That is  $U \in \{F \subset X : F^c \in \tau\}$ . Thus  $U$  is a  $\alpha$ -closed set, then  $scl(U) = U$ . Also  $scl(A) \subset scl(U) = U$ . Hence  $A$  is  $sg\alpha$ -closed set in  $X$ . Conversely, suppose that every subset of  $(X, \tau)$  is  $sg\alpha$ -closed. Let  $U \in S\alpha O(X, \tau)$ . Since  $U \subset U$  and  $U$  is  $sg\alpha$ -closed, we have  $scl(U) \subset U$ . Thus  $scl(U) = U$  and  $U \in \{F \subset X : F^c \in \tau\}$ . Therefore  $S\alpha O(X, \tau) \subset \{F \subset X : F^c \in \tau\}$ .

**Definition 3.41** The intersection of all semi generalized  $\alpha$ -open subsets of  $(X, \tau)$  containing  $A$  is called the semi generalized  $\alpha$ -kernel of  $A$  and is denoted by  $sg - raker(A)$ .

**Lemma 3.42** Let  $X$  be a topological space and  $A$  be a subset of  $X$ . If  $A$  is a  $\alpha$ -open in  $X$ , then  $sg - raker(A) = A$  but not conversely.

**Proof:** Follows from definition 3.41.

**Lemma 3.43** For any subset  $A$  of  $X$ ,  $sg - raker(A) \subset sg - raker(A)$ .

**Proof:** Follows from implication  $S\alpha O(X) \subset \alpha O(X)$ .

**Lemma 3.44** For any subset  $A$  of  $X$ ,  $A \subset sg - raker(A)$ .

**Proof:** Follows from definition 3.41.

**Theorem 3.45** A subset  $A$  of  $(X, \tau)$  is  $sg\alpha$ -closed if and only if  $scl(A) \subset sg - raker(A)$ .

**Proof:** Suppose that  $A$  is  $sg\alpha$ -closed. Then  $scl(A) \subset U$ , whenever  $A \subset U$  and  $U$  is  $\alpha$ -open. Let  $x \in scl(A)$ . Suppose  $x \notin sg - raker(A)$ ; then there is a  $\alpha$ -open set  $U$  containing  $A$  such that  $x$  is not in  $U$ . Since  $A$  is  $sg\alpha$ -closed,  $scl(A) \subset U$ . We have  $x$  not in  $scl(A)$ , which is a contradiction. Hence  $x \in sg - raker(A)$  and so  $scl(A) \subset sg - raker(A)$ . Conversely, Let  $scl(A) \subset sg - raker(A)$ . If  $U$  is any  $\alpha$ -open set containing  $A$ , then  $sg - raker(A) \subset U$ . That is  $scl$

$(A) \subset sg - raker(A) \subset U$ . Therefore,  $A$  is  $sg\alpha$ -closed in  $X$ .
